$$P = \frac{N^2 \alpha^2 dT^2}{4 \cdot N \cdot \rho_{TE} \cdot \frac{H}{L^2}}$$

$$P = \frac{N \alpha^2 dT^2}{4 \cdot \rho_{TE} \cdot \frac{H}{L^2}}$$

$$P = \frac{V \cdot \alpha^2 dT^2}{L^2 \cdot H \cdot H \cdot P_{TE} \cdot \frac{H}{I^2}}$$

$$P = \frac{\sqrt{\alpha^2 dT^2}}{4 \cdot \rho_{TE} \cdot H^2}$$

au volume.

Or, on veut optimiser <u>Puissance</u> et on sait que le cout est proportionel

Donc,
$$f(X) = \frac{x^2 dT^2}{4\rho_{TE} \cdot H^2}$$
 $\longrightarrow f(X) = \frac{x^2 \cdot \left(\frac{K}{K + 2K_0} \Delta T\right)^2}{4 \cdot \rho_{TE} \cdot H^2}$

On veut optimiser H, L, x

$$f(X) = \alpha^{2} \left(\frac{K}{K+2K_{0}} \cdot \frac{\dot{m} c_{p}}{K_{0} K_{0} K_{0} + \dot{m} c_{p}} \right)^{2}$$

$$\frac{H \cdot \rho_{TE} \cdot H^{2}}{K+K_{0}}$$

$$f(X) = \alpha^{2} \cdot \left(\frac{K}{K+2\left(\frac{2N k_{TE} L^{2} Kp}{2N k_{TE} L^{2} + K_{pH}}\right)} \cdot \left(\frac{\frac{\dot{m}c_{p}}{2N K_{TE} L^{2} Kp}}{\frac{2N K_{TE} L^{2} + K_{pH}}{N}} \right) \times \left(\frac{\frac{\dot{m}c_{p}}{2N K_{TE} L^{2} + K_{pH}}}{\frac{2N K_{TE} L^{2} + K_{pH}}{N}} + \dot{m}c_{p}}\right) \right)$$
